1A 0:00

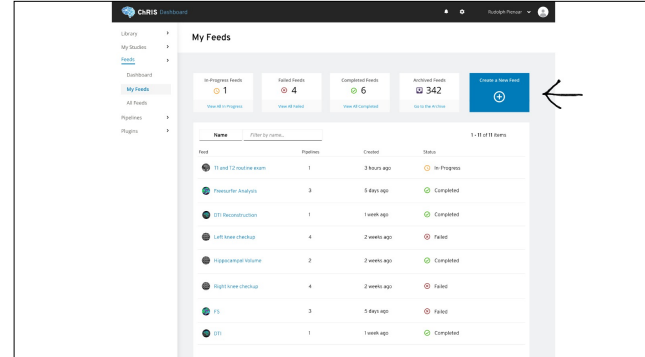

Let's start by performing a brain volume calculation in ChRIS.

2A 0:02

First, we'll log in.

3A 0:04

This is a list of my feeds in the system. Feeds are working spaces where you can run plugins and pipelines of plugins on data and experiment.

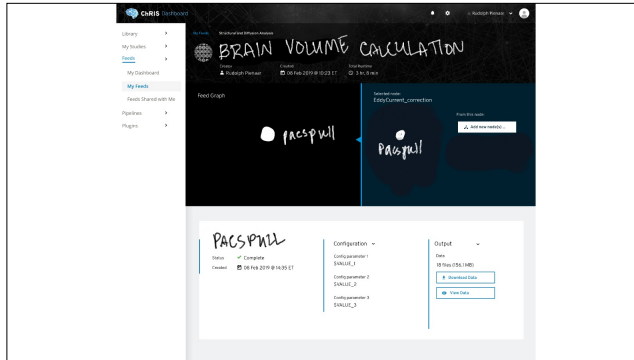

Let's create a new feed for our brain volume calculation.

4A 0:06

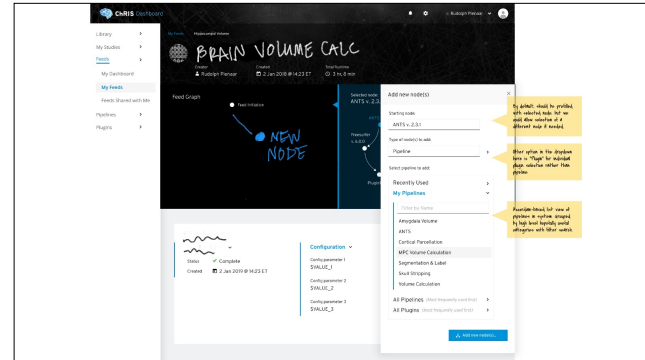

We'll create a new feed via this form. [TODO need design for this]

5A 0:08

We're going to start with this simple feed that pulls in data from the PACS, and build out the brain volume calculation by adding plugins to the feed.

6A 0:10

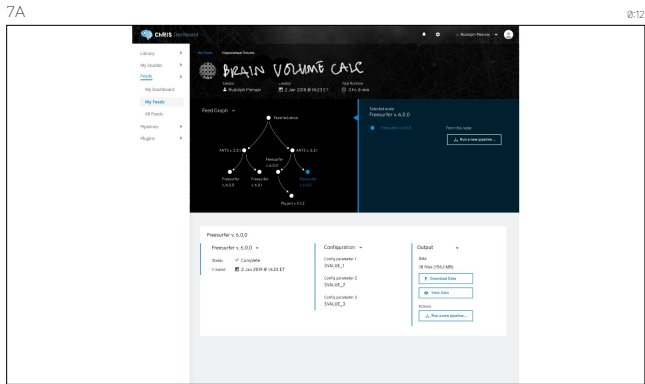

First I'll start by adding [\$1] node... (rinse & repeat, \$1 - \$N needed...)

Page: 2 / 3

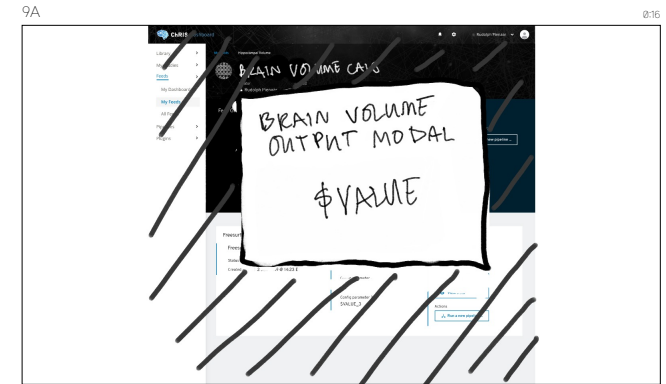

Now we've created a feed that will be able to provide us a brain volume calculation. Let's run it.

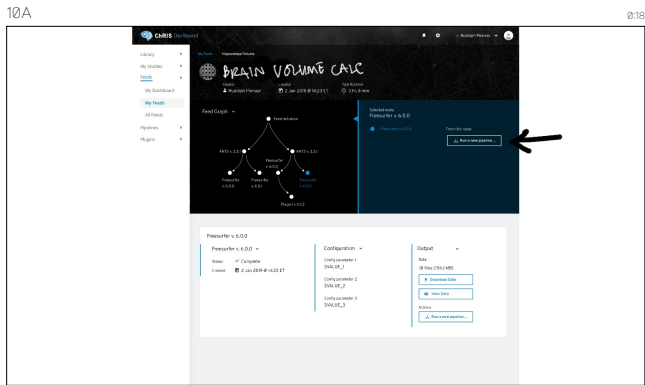

[Q: is there an explicit "run" button we need for feeds?]

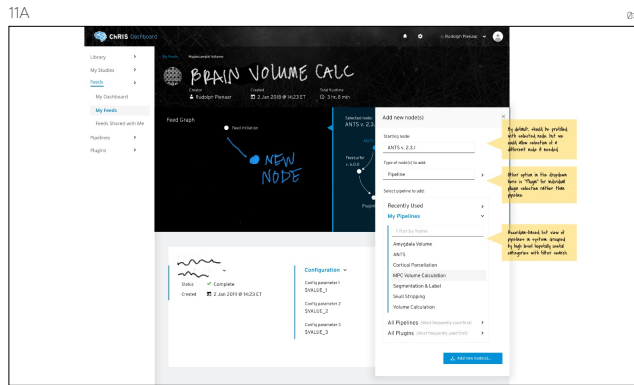

[Narrator clicks on 'output' button from one of the plugins to show the MRI viewer]

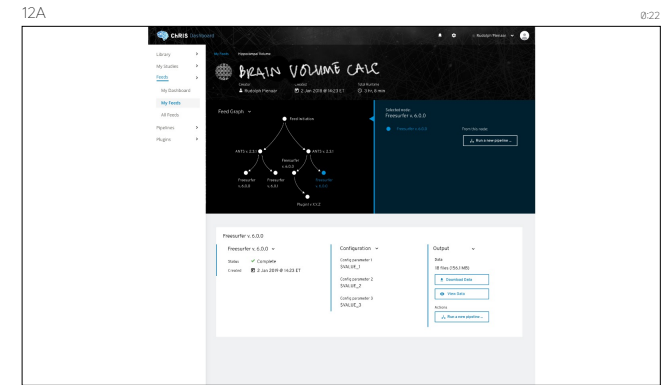

If I click on this last node, I'll get the value of the brain volume calculation that just completed.

Now we'll add a new plugin to this feed - the Multi-Party Compute (MPC) plugin. This will allow me to understand how the volume I just calculated fits within ranges calculated for data from multiple other medical institutions - while maintaining the privacy of those institutions' data.

[Clicks on add new nodes] Here's the MPC Volume calculation plugin.

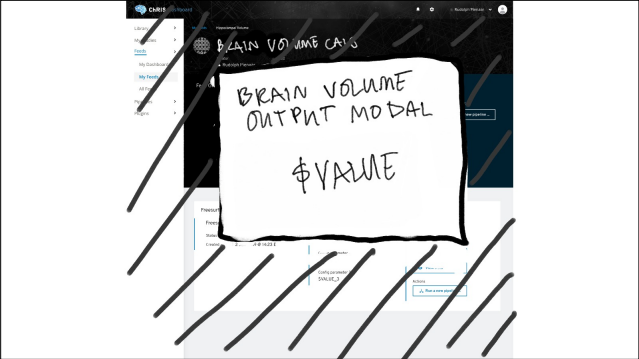

Now we'll run it and wait for the data to come back from the various institutions.

13A 0:24

It's complete! We can click on output here to view the results.
